*Anesthesia &  
Pain Management*

## What is Pain Management?

Pain management is a medical specialty focused on the diagnosis and treatment of pain and related disorders with the application of interventional techniques in managing various types of pain. Focusing on chronic pain rather than acute pain, it can work independently or in conjunction with other treatment.

Acute pain is of sudden onset and is usually the result of an injury, surgery, or medical illness and often goes away with the healing process. Chronic pain persists for weeks or months and is usually associated with an underlying condition, such as arthritis. The severity of chronic pain can be mild, moderate, or severe.

The primary goal of pain treatment is to return the patient to optimal function.

## Pain Management Techniques

Interventional pain management techniques are minimally invasive procedures which may include a single approach or a combination of medications, therapies and procedures. The degree of pain varies from person to person so each treatment plan will be customized to your specific needs.

## Pain Specialists

Pain specialists come from many different specialties and have advanced training and expertise. Most common are anesthesiologists, physical medical rehabilitation specialists and neurologists. Pain specialists are experts at both treating pain and helping to diagnose the source

of pain.

Common chronic symptoms treated:

- low back pain
- neck pain
- headaches
- cancer pain
- shingles
- sympathetic dystrophy
- nerve problems
- arthritis
